

What's New

What's new in NetVizura version 5.3.0:

NETFLOW ANALYZER

- We introduce a new volume alarm threshold condition - an alarm can be triggered once volume exceeds a defined baseline during a 1-minute interval. This means that you can be alarmed nearly in real-time
- IPv6 addresses are now supported
- Minor bugfixes were made

If you still have not migrated NetVizura to version 5.x, please refer to the NetVizura 5.2 changelog to gather the necessary information regarding the upgrade.
