

NetVizura Data Migration

After many great years with PostgreSQL, we have transferred to the ElasticSearch database as our only source for storing NetFlow data. Our ultimate goal is to introduce a lot of new, amazing features, and this transition was a necessary requirement. We are really excited about the new opportunities that are in front of us, so stay tuned for many novelties that are to come.

Data migration is only required if you are using previous versions of NetVizura (NetVizura 4.7.4 and older). Once you complete data migration, it is **not possible to migrate data back** to NetVizura 4.x version.

IMPORTANT NOTE: If you have both NetFlow Analyzer and EventLog Analyzer modules, please contact support@netvizura.com before clearing data from PostgreSQL.
