

Whois lookup

If you don't want to see Whois information for your Internal Address in All Traffic Pattern, you can disable it. It is useful, for example, when your internal address range is public address range by default.

To enable (disable) Whois lookup for All Traffic Internal Addresses:

1. Go to [blocked URL](#) > **Settings** > **NetFlow Settings** > **Configuration** > **Whois lookup**
2. **Select Enable (Disable)**

Once you change status of Whois lookup in Settings from Enabled to Disabled and vice versa, it is necessary to refresh the observed view in NetFlow module by pressing the Refresh button in the upper right corner.

The screenshot shows the 'Configuration' tab of the NetFlow Settings. The 'Whois lookup' dropdown menu is highlighted with a red box, showing options: Enabled, Disabled, and Disabled. The 'Reverse DNS lookup' dropdown menu is also visible, showing options: Enabled, Disabled, and Disabled.

Disabling Whois lookup will not disable DNS resolution for Internal Address in All Traffic Pattern
